

A Faecal Sludge Treatment Plant (FSTP) is being proposed in the district to ensure the safe and scientific treatment and disposal of sludge generated from septic tanks and toilet pits. At present, in certain locations where Sewage Treatment Plants (STPs) are already proposed or operational, this activity is being carried out, through which several Gram Panchayats are being covered for faecal sludge disposal.

In the next phase, efforts will be made to reduce dependency on existing STPs and to expand dedicated FSTP-based treatment facilities across the district. Accordingly, planning activities and site identification processes are in progress, and necessary schemes are being formulated to strengthen faecal sludge management and improve sanitation infrastructure throughout the district.
