GREY WATER MANAGEMENT

Budaun district is implementing effective greywater management solutions through soak pits, filter chambers, silt catchers, and waste stabilization ponds. These systems help in treating and reusing wastewater, reducing environmental pollution, and conserving water resources. Soak pits allow water to percolate into the ground, filter chambers and silt catchers remove impurities, and waste stabilization ponds further treat the water before safe disposal. To ensure efficiency, regular cleaning and maintenance of these assets are carried out by safai karamcharis. This initiative enhances sanitation, promotes hygiene, and supports sustainable water management in the district.
